COLONY, HONEY PLANT AND MARKET CONDITIONS DURING SEPTEMBER, 2016

APPALACHIAN DISTRICT (MD, PA, VA, WV): There was some relief from the drought conditions in September as showers and thunderstorms finally arrived near the end of them month. Temperatures did continue above normal, but the cool fronts returned temperatures to more normal levels by mid-month. Bees that would forage were doing so on various wildflowers such as asters, goldenrod, joe-pye weed, and milkweed. Beekeepers continue to provide sugar water to colonies in some areas of the District where pollen and nectar sources are limited. Beekeepers are also preparing for various state and county association meetings.

ALABAMA: Now that the fall season is in full blossom and the year is coming to a production end, it can be said that, due to long season dryness, only a decent honey crop was obtained in much of the state. As is so often the case in statewide weather patterns, the southern parts of the state from Dothan to Mobile had ample moisture of a while, but even now that part of the state is dry.

Goldenrod and fall asters are in bloom, but little nectar – is any is being – produced by these common fall plants statewide. Diseases have only been typical problems and small hive beetles continue to annoy and even cause absconding to occur. Indeed, several reports of absconding have been reported. The lack of moisture mostly likely paid a part in this behavior.

Finally after many months of trying, oxalic acid as a control for Varroa mites has been approved in Alabama. Beekeepers were glad to get that news.

ARIZONA: Temperatures in Arizona were at above normal levels during the first week of September, were at normal levels the second week of the month, and were below normal levels for the remainder of the month. The range statewide in temperatures for the month was from a high of 114 degrees Fahrenheit in Yuma to a low of 26 degrees Fahrenheit in Springerville.

During the month of September, the weekly number of reporting stations across Arizona to receive precipitation (out of 50 stations) were 30, 30, 24 and 13, respectively. Out of the 50 reporting stations, 15 are at above normal precipitation levels for the year, with 35 stations at below normal levels for the year.

The main nectar and pollen sources for bees in the state during the month of September was desert plant bloom, alfalfa, cotton, with some cantaloupes and honeydews. Demand for honey was good.

ARKANSAS: No report issued.

CALIFORNIA: The month started out dry, with cooling temperatures finally beginning to move into the State. Cooler air settled across the mountains, the valley early in the week, and into the southern desert. Temperatures fluctuated throughout the month, as we headed into fall. There was no measurable rainfall in the state. Towards the close of September a few rain showers fell in the Sierra, mixed with snow showers at higher elevations, however mountain tops still remain absent of snow.

The bee colonies are starting to be moved into winter locations, and the hives have become more compact. Bees are being fed sugar syrup and supplemental feeding will begin later this month. On the warmer parts of each day the bees are very active and appear to bring in pollen on their own. Early in the month, some colonies were moved into the Sierra foothills to take advantage of the Tarweed bloom. Very little pollen and nectar was gathered, however. Some bees were still working melon and squash fields. Beekeepers are in the process of extracting the last bit of honey for the season. Overall bee health is good, and colonies appear to have produced a good supply of winter bees.

FLORIDA: Hurricane Hermine crossed the northwestern part of Florida in early September resulting in heavy rainfall totals in many areas and some wind damage, but not much reported damage to bees. Most other areas of the state experienced about normal temperature and precipitation for the month. Many beekeepers reported their bees were in the best condition that had seen in the last five years or more. A few reported higher than expected death losses primarily from varroa mite infestations. There was an occasional report of death losses from increased mosquito spraying or spraying specifically done to control the Zika virus, but those losses appeared to be minimal. Brazilian Pepper starting blooming on the West coast and was in full bloom on the East coast before the end of the month, approximately two weeks ahead of schedule. Spanish Needle, Goldenrod and assorted wildflowers were also available in most areas. Supplemental feeding was considered by some to be necessary. Preliminary reports from the West coast indicated that Brazilian Pepper honey production was considered to be about normal although prices were reported to be in the \$1.50-\$1.60 per pound range. This would be considerably less than last year's \$2.00+ reported by most beekeepers. It will be about two more weeks before much honey will be removed from the hives and a better estimate of honey production can be made. Supplies of honey available for sale remain light with good demand.

GEORGIA: A lighter Fall honey crop is expected this year in most areas in the Central and Southern areas of the state. The Northern areas have fared better and should have a nice Sourwood crop this year. A few minor problems with the last storms that came through in September with excess water from rain and wind blown objects and debris. Most of the beekeepers are busy cleaning up the yards and preparing the hives for the fall months to get enough food in before winter arrives.

Prices have dropped this year with offerings of \$1.50 to \$1.75 with an average of \$1.60 for bakery grade honey. Competition from Canada and Argentina have stirred up the domestic offerings and some are waiting to sell in anticipation of stronger price returns later.

Many areas of the state are having drought conditions, while some areas are in good shape. Some reports of Varroa Mites have shown up in hives not continuously treated and are being managed at this time for further preventive measures.

IDAHO, COLORADO, UTAH: During the month of September temperatures were above normal over most areas of Colorado and Utah. Most areas of Idaho had below normal temperatures during the same period. Precipitation was normal to below normal across most of Idaho, Utah and Colorado with the exception of above normal precipitation around Vernal, Utah during the month of September, according to the National Weather Service.

According to the U.S. Drought Monitor, Colorado continues to have near normal moisture conditions across most areas of the State in September with the exception of continued abnormally dry conditions in the Northwest and Northcentral part of the State. Normal moisture conditions are present in Southeast and Southwest Utah and the Southwestern area of the State of Idaho. There were abnormally dry conditions in the rest of Idaho and most other areas in Utah. An area south of the Great Salt Lake in Utah was experiencing a moderate to severe drought during the month of September.

The 2016 honey production year is certainly not turning out as good as commercial honey producers had hoped for across Colorado, Utah and Idaho. Many commercial beekeepers are still harvesting honey, but should finish around the end of September or first part of October. What honey has been harvested looks like a quality crop. With warmer temperatures still prevailing in Idaho, Utah and Colorado, beekeepers indicated that bees are still flying. And although there is not much nectar available from foraging activities, there is still a fair amount of pollen that is making its way back to the bee colonies. According to commercial beekeepers, most of their bees are looking very healthy and heavy at this time. They have not experienced many bee losses in September as well.

As beekeepers pull off frames of honey, they are feeding supplemental diets at this point on an as needed basis to build colonies going into the fall and winter period. They are also treating for varroa mites. Varroa mite tests seem to be coming in at manageable levels at the end of September.

Overall demand for Idaho, Utah and Colorado honey is still very good and exceeds the local domestic production capacity. Current commercial prices for white honey range from \$1.70 to \$1.85 per pound depending upon quality and quantity. Extra light amber is around \$1.80 per pound and Light amber is around \$1.65 per pound at the wholesale level. With the reports of lower than normal honey production in Idaho, Colorado and Utah this season, revenue from pollination services becomes very important moving forward for commercial beekeepers to remain viable. According to commercial beekeepers, the driving force on the lower prices they currently receive is influenced greatly by cheaper priced imported honey coming into the United States. Due to the currency rates favoring imported honey compared to domestic honey, many commercial beekeepers are having a harder time turning a profit. Most commercial beekeepers plan on staying in their home States until November. At that time commercial beekeepers from Utah and Colorado will be heading south or on to California. Some commercial beekeepers in Idaho will start placing their bees in storage sheds starting in November.

ILLINOIS: Temperatures for the month of September started with higher than normal temperatures with a few days of 80 degrees, but later in the month temperatures were down in the mid to low 60s. There was a light amount rainfall. Some beekeepers are having problems with mites and beetles and are treating accordingly. Most beekeepers report that their bees are in good to excellent condition. Beekeepers also report a little bit of foliage for their bees to feed on, such as goldenrod and aster. Production has varied around the state. Some Beekeepers report a fair amount, while others say there has been very little production. Demand for honey is good at the retail level and fairly good at wholesale level. Prices are generally unchanged.

INDIANA: Temperatures for the month of September were good and have recently turned cooler with most days in the 60s. Rainfall in most parts of the state was above average for this time of the year. Beekeepers report that their bees continue to feed on foliage, such as goldenrod. Beekeepers report their bees in good condition and that they have a healthy population. Beekeepers report a presence of mites and have begun treatment with oxalic acid. Beekeepers report that they have had acceptable production in September. Prices are generally unchanged.

IOWA, KANSAS, MISSOURI, NEBRASKA: Weather conditions were mostly hot and humid. Temperatures and precipitation were above normal. Nebraska experienced below normal temperatures as cooler conditions were recorded.

Beekeepers were busy harvesting and pulling remaining supers, attending meetings, classes and winterizing bees. There were mixed reports of crop success as some beekeeper pulled a good crop as others harvested less or little. European Foulbrood was experienced by some beekeepers. Treatment was encouraged. The queen egg production continues to slow as drones population dwindles. Bees were working various fall ornamentals. Honey demand and sales remain strong.

KENTUCKY: September seemed to start slowly in terms of a nectar flow for KY beekeepers throughout the Commonwealth. In doing USDA-APHIS Honey Bee samples around the state, many hives were bringing in nectar from sunflowers, asters, goldenrod, and smartweed although only in moderate amounts. Ironweed flowers seemed to be a bit of disappointment. Many beekeepers needed to provide supplemental feed or equalize by moving honey from strong hives to first-year hives or hives started from swarms. A lot of backyard beekeepers have taken no honey at all for fear of leaving their hives without stores. There have also been more than a few beekeepers reporting high mite counts and some related varroa-mite damages, such as deformed wing virus, Israeli Acute Bee Paralysis virus, and deformed bee larvae. Furthermore, because high temperatures extended well into September (the first day of Fall was 92 degrees F), small hive beetles have been a serious problem, with backyard beekeepers reporting losses throughout the state. There have also been robbing incidents because beekeepers do not realize how dry it is for this month, and have inadvertently triggered robbing when leaving hives open or supers exposed a bit too long.

LOUISIANA: No report issued.

MICHIGAN: The fall flow has been spotty and many hives are light on winter stores. Beekeepers have been feeding bees to provide the necessary sustenance. Goldenrod and some asters have been the main nectar and pollen flow sources. There have been some reports of higher mite loads going into fall, thought to be migrating mites from crashing hives nearby. It is essential to monitor the hives and treat if necessary prior to the onset of winter. Honey sales have been very good and demand appears to be stable. Currently, beekeepers have ample amount of stores at hand, due to an excellent summer flow.

MINNESOTA: During the month of September temperatures were above normal across the entire State. Precipitation was below normal in Northern locations and above normal in Southern areas of the State, according to the National Weather Service. According to the U.S. Drought Monitor, moisture conditions are normal over the entire State of Minnesota.

The 2016 honey production year has certainly not turned out as good as commercial honey producers had hoped for across Minnesota. With warmer temperatures and the lack of freezing temperatures to kill vegetation still prevailing in Minnesota, beekeepers indicated that bees are still flying. And although there is not much nectar available from foraging activities, there is still a fair amount of pollen that is making its way back to the bee colonies. Since the late freeze in the spring of 2016 that caused damage to the Basswood blooms, it has been a struggle for beekeepers. Many of the commercial beekeepers depend upon a good bloom set on Basswood trees and without the normally abundant crop of nectar from these trees, the resulting honey crop

overall has been a huge disappointment in Minnesota this year. Tallies of honey per colony are coming in way below normal towards the end of September.

Commercial beekeepers have just about finished pulling honey frames from colonies. As frames are removed beekeepers are treating for varroa mites. In some cases, according to beekeepers, the treatment is coming a little too late. There have been some major losses this fall in some colonies due to excessive varroa mite damage. Upwards of 50 percent losses of bees in some yards have been reported. Exact cause for this excessive mite load has not been determined yet. It is a theory that there may have been a higher population of undetected mites earlier in the season that was not known. Or spring treatments were not as effective as earlier thought. As beekeepers remove frames and administer varroa mite treatment they are also taking the opportunity to provide extra supplemental corn syrup and pollen substitutes to build colonies going into the fall and winter period where needed. Overall some colonies look good and some do not. Not as many issues have risen about Queen Bees during this season in Minnesota.

Overall demand for Minnesota honey is still very good and exceeds the local domestic production capacity. Current commercial prices for white honey range from \$1.65 to \$1.75 per pound. With the reports of lower honey production in Minnesota this season and reduced income revenues coming from sale of that raw honey, revenue from pollination services becomes very important moving forward for commercial beekeepers to remain viable. According to commercial beekeepers, the driving force on the lower prices they currently receive is influenced greatly by cheaper priced imported honey coming into the United States. Due to the currency rates favoring imported honey compared to domestic honey, many commercial beekeepers are having a harder time turning a profit. Most commercial beekeepers plan on staying in Minnesota until the end of October, at which time they will make the trip to Southern States or to California for the 2017 almond pollination season.

MISSISSIPPI: The bees are reported to be in good shape heading into the Fall months and the upcoming Goldenrod flow. The demand remains strong and quality good with low moisture and light amber in color. Prices have dropped to \$1.80-2.00 per pound for wildflower honey. Year round treatments for mites and other problems have kept the hives and bees in good condition and beekeepers are continuing management as currently needed.

MONTANA: No report issued.

NEW ENGLAND: New England weather for the month of September featured warmer than normal temperatures with an extended period of summer weather with many locations with record highs for the season. Keepers report huge populations of bees easily filling the entire area of 2 deeps for brood rearing with them constantly being used and refilled. In this regard many hives appear strong and heavy. Bees have been working celthra alnifolia, Mexican & Chinese bamboo, fall aster, staghorn sumac, white & sweet clover, thistle, purple loose strife, button bush, assorted wild weeds especially knotweed, sweet pepper bush, assorted wild flowers and particularly golden rod. Other late food sources still blooming are buckwheat, Indian silk and coreopsis to finish the month. The ornamentals, Joe-Pye weed, pickerel weed, sedum (stone crop) are out in abundance as well as jewel weed which leaves a slight white pollen mark on the thorax.

Overall bees are working hard with a strong population buildup. At this point in time, many keepers re-queen in the fall in order to have a strong, healthy queen and brood for the spring. The amount of brood rearing in the fall affects the winter adult population. The more young bees produced in the fall, the more adult bees there will be available for winter brood rearing. The queen begins reducing egg laying in November and may stop completely in December. Reportedly, many queens have stopped laying in many hives early with many new beekeepers concerned that they are going into winter without queens. In this case, many purportedly are showing a shortage of honey and pollen as well. Keepers advise on the need to observe 3 or 4 frames of brood in the early fall and plenty of food stores. Keepers are looking to maintain 3 or more deep frames of brood for as long as the queen will lay. Ideally, heavy egg laying is necessary by mid-September and feeding 2:1 sugar syrup will stimulate the queen to lay more heavily. At this time, keepers want to see 10 or more frames full of bees.

Currently bees are working diligently at storing as much nectar as possible. They are also working at evaporating moisture from the nectar. As the nectar is cured into honey, the bees will move the honey and arrange the stores for winter. Keepers inspect and are proceeding with the arrangement of honey supers for winter with the final setup being brood in the bottom with honey and pollen in the top. In early fall keepers will ensure that there are a couple of frames of honey on the outer edges of the bottom box. Keepers state that if the queen does not move to the bottom box by early October, then keepers will proceed to move all the brood frames to the bottom so honey can be stored in the top box and this will ensure that the top hive box is either full or advancing to be so by sugar feeding by the beginning of November. Keepers need as many young healthy bees as possible for the winter. Bees live longer in the winter because they don't get worn out foraging. Beekeepers have been busy concentrating on extracting honey as well as winter preparations which focus on the treatments for nosema, chalkbrood, wax moth, hive beetle, and also American foulbrood, varroa and tracheal mites.

In New England, this is traditionally the time when beekeepers are stripping off any remaining honey supers and treating their colonies for varroa mites. Additionally, it is also the beginning of the winter management cycle as beekeepers try to get their colonies as well fed and healthy before winter bees are bred. This is also the month we begin to see the precipitous increase in varroa mite population which, if left unchecked, can devastate a colony by late fall. Depending on location, the honey flow is ending thus it is time to take out fully capped frames for extraction while leaving enough for fall/winter feeding. Nutrition in the form of natural forage is now very limited and sugar syrup and pollen substitutes are needed to improve colony survival and performance.

Seasoned beekeepers have observed that early on- back in July, many hives had high levels of mite infestation with the possibility that nosema disease was the main causal agent. Several keepers complained about slow growth in their hives. It would logically follow that a shortened lifespan of workers would consequently impact the foraging population and thus result in less nectar collection. Some experienced beekeepers advised treating with Fumigellin-B and consequently observed marked improvement after treatment for nosema. Nosema disease has been a growing concern, hence more difficult for beekeepers to identify and being blamed for hives failing to thrive. Reportedly this year, there has been a huge increase in wax moth presence especially on bottom boards and on inside covers due to warmer weather. Wax moth and mice were a big problem last winter and spring. More attention to mouse guards and preventing wax moths are being discussed at bee association meetings. Keepers report that hives are showing early eviction of drones and swarming was a problem in several regional areas.

Seasoned keepers claim that September is the final exam for beekeepers. If you can control varroa mites and nosema disease then you will improve the chances of winter survival by four. In many regional areas, purportedly mites have been heavy and many keepers are still trying to get honey off hives and treat for mites. Reportedly, the new formic acid quick strips seem to be the preferred treatment, however, back orders have held up beekeepers from getting them earlier. Overall, the 2016 season was a reasonably good season by exhibiting the noted concerns with bee health, a much higher average of honey production and good conditions for queen rearing.

Demand at all retail/wholesale outlets remains good and honey sales remain firm. Prices quoted for retail 1lb bottled units were strong and quoted at \$9.00 to \$12.00 mostly \$10.00 and occasionally higher inclusive of all varieties; for food service operations prices were strong with 5 gallon units selling at \$200.00 to \$245.00 mostly \$220.00 occasionally higher for all raw and natural honey depending on variety and quality. Prices and demand for local and regional honey has been excellent.

Prices vary but prices quoted exclusively for white, cleaned beeswax are steady and for 1lb block units at \$5.50 to \$5.75 mostly \$5.50 and for 50lb block units at \$4.75 to \$5.00 mostly \$4.75. Price quotes taken for bulk orders above 50lbs are \$2.20 to \$3.50 mostly \$3.50 for white/light, cleaned beeswax. Gray colored utility wax can be bought for less. Retail wax prices are \$16.00-20.00 a pound cleaned. White wax is the most expensive. Most hobbyists like a canary yellow color for candle making with the color being determined by pollen and honey color.

NEW YORK: In the Central region of the state, summer going into fall has been the driest on record. Creek beds are dry and ponds are mud flats; Taughannock Falls (the highest falls east of the Mississippi) has only a trickle dripping currently. The draught has also been devastating for vegetable growers in the area, who ran out of irrigation water long ago. The beekeepers fared slightly better and the rain that has passed through has been sporadic, hitting one area hard, while totally missing the neighbors. Consequently, the bigger beekeepers with yards spread over a larger area could have been buffered somewhat. Bees are in rough shape without having been fed in August; the August dearth was extremely high. The hives have mites, not great quantities of pollen and the goldenrod/aster flows were marginal, leaving the hives in less than optimal conditions for overwintering. It was difficult to raise queens and do splits this summer without extensive feeding; thus the summer nuc build up was inconsistent. One plant that seemed to fare well this month has been Japanese Knotweed, as it has large tuberous roots and is an invasive species along swamps and lowlands. The plants produces a rich, dark red-brown honey that is very good, although not preferred by tea drinkers, who prefer lighter honey. There is talk that the bigger producers are looking for light spring honeys to supplement their meager crops. The low production estimates, an average of 60% of what would be an average crop, should increase wholesale and consequently retail prices, especially for the light spring honeys. Good local varietal honey could sell for \$8.00 pound retail, although \$6.00-7.50 more likely. Once the fall crop is recovered and projections established, the wholesale prices per pound in the Northeast will potentially see new highs.

NORTH CAROLINA: Temperatures in North Carolina were above normal throughout September. Precipitation varied by region with the Coastal Plains receiving some much needed rainfall by way of Tropical Storm Hermine; while the Western Piedmont and Mountain regions remained dry. Overall, statewide soil moisture levels were rated 8 percent very short, 19.5 percent short, 53 percent adequate, and 19.5 percent surplus the week ending September 24. The North Carolina Drought Management Advisory Council reported 35 counties as being abnormally dry, 18 counties experiencing moderate drought conditions, and 2 county suffering from severe drought conditions.

Colony condition continued to vary by management practices and experience. According to apiary inspectors, some hives were very healthy and strong, while others were struggling. Those that did not manage well for mites were suffering from various stages of bee parasitic mite syndrome, as well as increased populations of small hive beetles. Other pressures included excessive heat, high humidity, and little rainfall; leaving the fall nectar flow very light. Where available, bees could be seen working Aster throughout the state; Heartsease, Smartweed was available in the Piedmont region as well as Goldenrod which stretched east to the Coastal Plains region.

Consumer demand for honey remained high as supply remains light. Retail prices at the Raleigh State Farmers' Market remained steady and were: \$8.00 per 8 ounce jar, \$13.00 per 16 ounce jar, \$22.00 per 32 ounce jar, and \$18.00 per 44 ounce jar. Prices at the Piedmont Triad Farmers' Market in Greensboro were: \$8.00 per 8 ounce jar, \$12.00 per 16 ounce jar, and \$20.00 per 32 ounce jar.

Commercial pollinator hives from the Western Piedmont were moved to Florida in September to take advantage of the Brazilian Pepper tree flow; as well as the warmer winter temperatures in hopes of building strong colonies that will produce replacements bees to sell in early 2017.

NORTH & SOUTH DAKOTA: The weather is cooling off and the harvests are winding down. Final cuts on alfalfa and sunflowers are finished. Crops were finishing about average some ahead and some slight behind generally depending on location and weather patterns. Honey production is mixed depending on location but generally better than last season in most areas. Beekeepers are preparing and moving bees to their winter homes.

OHIO: Beekeepers are disappointed with little to no summer honey crop due to drought. Recent rains have helped but the verdict is still out on a fall harvest. Supplemental feeding has been a must for everyone this year. Lots of colonies had drones kicked out this summer due to the lack of food, and many beekeepers were actually feeding most of July just to keep up. On a more positive note, mite pressure has been light and beetles nearly non-existent in northeastern Ohio. Honey prices are strong at local farm markets, although shelf prices appear to be weak. Demand for local honey continues to grow, especially with lots of news regarding bees available in the media.

OKLAHOMA: No report issued.

OREGON: No report issued.

SOUTH CAROLINA: No report issued.

TENNESSEE: The fall flow finally started in late September. Goldenrod and asters are finally producing nectar. Small hive beetles have been an issue sporadically across the state causing colonies to abscond.

TEXAS: No report issued.

AUGUST 2016

ĺ

Year to Date

WASHINGTON: Apple and pear harvest is in full swing. The weather has generally been very good with moderate temperatures and cooling and night for color on the apples. Bee activity was winding down and some supplemental feeding was going on. Beekeepers were preparing for fall and winter some staying local, others moving to overwinter homes.

WISCONSIN: Temperatures for the month of September were normal and rainfall was above average for the state of Wisconsin, according to a few of the beekeepers. They have begun combating mites with miticidal strips and oxalic acid. They report a normal, healthy population of bees. Beekeepers report very little wild foliage for their bees with goldenrod and aster as the only flowers remaining. They have begun supplemental feeding of the bees. No production reported in September was reported. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.

U.S Exports of Honey By Country, Quantity, and Value

| | Year to Date | | AUGUST | | |
|---|--------------|-----------|--------------|---------|--|

Notes:

- 1. Data Source: Department of Commerce, U.S. Census Bureau, Foreign Trade Statistics
- 2. All zeroes for a data item may show that statistics exist in the other import type. Consumption or General.
- 3. (*) denotes a country that is a summarization of its component countries.
- 4. Users should use cautious interpretation on QUANTITY reports using mixed units of measure. QUANTITY line items will only include statistics on the units of measure that are equal to, or are able to be converted to, the assigned unit of measure of the grouped commodities.
- 5. The CIF Value is not included within the 13th month data loads. This means that the CIF Value will be zero (0) for any records that are inserted during this process.
- 6. Product Group: Harmonized
